

Open Broadband - Simple Two-Way Active Measurement Protocol (OB-STAMP)

Introduction

The OB-STAMP (Open Broadband – Simple Two-Way Active Measurement Protocol) aims to create an open-source implementation of a STAMP Sender and Reflector, fully compatible with RFC 8762 and its associated extensions, to be installed on a Customer Premises Equipment (CPE). The application must run as a containerized application within the CPE following the User Services Platforms (USP) paradigms. The purpose is to develop a component outlined in the TR-390.2 document, thus facilitating the capacity to perform performance measurement between the customer's equipment and the IP Edge. The (soon-to-be) TR-390.2 Amendment 1 document also describes the feasibility of using the STAMP protocol to take the performance measurements in the subscriber home network.
